                The polypeptide is prepd. by genetic engineering of genes encoding the P. falciparum circumsporozoite (CS) protein [Dame et al., Science 225: 593 (1984)], and the influenza virus non-structural protein 1 (NS1), [Baez et al., Nucleic Acids Research, 8: 5845 (1980)]. The DNA encoding the 1st 81 AAS of the N-terminal of NS1 (NS1_81) is linked to a synthetic sequence encoding four repeat units (the variant form) from the immunodominant region, which in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Key

Peptide
            Novel recombinant protein as vaccine for treating malarial infection comprises antigenic peptides obtained from different stages of plasmodium falciparum life cycle -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               linker. The peptide can be against malaria.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            contg. flanking region less the 18 AA signal region. This is linked to DNA encoding Region II-contg. flanking region. The Proresidue separating the Asp (at the C-terminal of the linker) from the Region I-contg. CS flanking region is an artifact of a filled-the Region I ste; the Gly separating the Region I and II-contg. CS flanking regions I and II-contg. CS flanking regions is an artifact of a synthetic Fokk/TthIII I flanking regions is an artifact of a synthetic Fokk/TthIII I linker. The peptide can be used in a vaccine for protection

The recombinant which is a multivalent, multistage malarial vaccine. The recombinant protein comprises, melittin signal peptide, (His)6 tag, T-cell epitope from tetanus toxoid and 21 antigenic epitopes from circumsporozoite protein (CSP), sporozoite surface protein-2 (SSP-2), liver stage protein (LSA-1), merozoite surface protein-1 (MSP-1), MSP-2, apical antigen-1 (LSA-1), erythrocyte binding antigen-175 (BBA-175), membrane antigen-175 (BBA-175) and gamete specific antigen, Pfg27. Thoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the life cycle of plasmodium falciparum. CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting p. falciparum in biological samples.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence of the CS gene (AAN81108) is from lambda-mpfl. A recombinant DNA molecule is claimed, comprising functional DNA coding sequence fused. DNA molecule is claimed, comprising functional DNA coding sequence fused. The phase, to a portion of the Pre-S2 region of a hepatitis B virus (HBV) in phase, to a portion of the Pre-S2 region of a hepatitis B virus (HBV) in phase, to a portion sequence. The functional DNA coding sequence comprises the Pre-S2 coding sequence, the CS protein coding sequence of Pre-S1-Pre-S2 coding sequence, the CS protein coding sequence of Plasmodium, or a HIV coding sequence such as Plasmodium, or a HIV coding sequence, e.g. HIV C7 protein coding region, HIV an HIV envelope gene sequence, e.g. HIV C7 protein coding region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Example; Fig 3Aa-3Af; 101pp; English.

                     The plasmodium CS gene was used to isolate peptides capable of inducing an immune response to the parasite. Peptide antigens be synthesised in pure form and used to generate an immune response in vaccination against malaria. The featured repeat units are claimed and must be present in copies of 2-1000.
                                                                                                                        New immunologically active pure synthetic peptide(s) - protection against infection by malaria parasite.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 lambda mPf1 encoding the complete CS protein gene P. falciparum into C vector pUCB. A recombinant DNA vector is claimed, which comprises a DNA sequence context. The coding sequence of the CS p. falciparum operatively linked to an expression control sequence. Prefd. expression control sequences include the yeast glyceraldehyde-3p-dehydrogenase gene (TDH3) promoter and the yeast tornithine carbamoyl transferase gene (ARG3) transcription termination region. A suitable coding sequence comprises the 1215bp Stul-Rsal fragment of WR201 contg. the P. falciparum CS protein coding sequence, minus its first 50bp. Also claimed is a transformed host cell, a method of culturing the cell to produce CS, the protein, and a vaccine. The vector comprises a 192 bp Sau3A fragment coding for 16 tetrapeptide repeats of the P. falciparum CS protein derived from Sau3A digestion of a 1215 bp Stul-Rsal fragment of containing the P. falciparum CS protein coding sequence minus such 192 bp Sau3A fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                          AAR82571-91 are helper T cell epitopes which can be used in the preparation of a peptide immunogen that is useful in vaccines for treating allergic reactions. In the immunogen an IgE CH4 peptide is attached C-terminally to a series of amino acids including a helper T cell epitope. The immunogen may also opt. contain a fatty acid or fatty acid derivative, an invasin domain or alpha-NH2. The immunogen produces high titres of antibodies to the effector site in human IgE heavy chain (the CH4 domain peptide) which inhibit mast cell activation and reduce allergen-induced IgE prodn. The immunogens may be used in either a radially branching multimeric form or a linearly arranged monomeric form.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                of the native protein's Cys residues at positions 384 and 389. Also claimed is AAP91504 (or modified forms, see FT) associated with an antigenic structure representing a B-cell epitope, pref. a multiple antigenic peptide, esp. multimers of the repeat sequences NANP present in P. falciparum CS protein.
                                                                                                                                                                                                                                                                         Claim 3; Page 23; 87pp; English.

               Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Circumsporozoite protein precursor - Plasmodium cynomolgi (strain Gombak)

N;Alternate names: major sporozoite surface antigen

C;Specles: plasmodium cynomolgi

C;Date: 30-Sep-1987 #sequence_revision 30-Sep-1987 #text_change 07-Nov-1997

C;Accession: E26255

R;Galinski, M.R.; Arnot, D.E.; Cochrane, A.H.; Barnwell, J.W.; Nussenzweig, R.S.; Enea,

Cell 48, 311-319, 1987

A;Title: The circumsporozoite gene of the Plasmodium cynomolgi complex.

A;Reference number: A90889; MUID:87102878

A;Accession: E26255

A;Molecule type: DNA

A;Residues: 1-401 <GAL>
C;Comment: There are three distinct regions in the mature circumsporozoite protein, the obic membrane-anchoring sequence

C;Comment: There are 17 tandem copies of the 11-residue repeat D/G-G-A-A-A-G-G-G-N.
C;Superfamily: circumsporozoite protein; thrombospondin type 1 repeat homology

C;Keywords: sporozoite; surface antigen; tandem repeat

F;1-19/Domain: signal sequence *status predicted <SIG>
F;20-401/Product: circumsporozoite protein *status predicted <MAT>

F;98-278/Region: 11-residue repeats

F;326-379/Domain: thrombospondin type 1 repeat homology <THR1>

FEMS Microbiol Lett. 150:33-41(1997)
-1- FUNCTION: TUBULIN IS THE MAJOR CONSTITUENT OF MICROTUBULES.
BINDS TWO MOLES OF GTP, ONE AT AN EXCHANGEABLE SITE ON THE I CHAIN AND ONE AT A NONEXCHANGEABLE SITE ON THE ALPHA-CHAIN.
-1- SUBUNIT: DIMER OF ALPHA AND BETA CHAINS.
-1- SIMILARITY: BELONGS TO THE TUBULIN FAMILY.
                                                                                                                                                                        InterPro; IPR000217; Tubulin.

cell. Biol. 14:6306-6316(1994).

Cell. Biol. 14:6306-6316(1994).

FUNCTION: TRANS-ACTING FACTOR IN THE REGULATION OF TRANSCRIPTION ACTIVATION IN INDICATED IN THE TRANSCRIPTION ACTIVATION AND IN DNA REPLICATION. INVOLVED IN THE TRANSCRIPTION ACTIVATION OF A SUBSET OF RIBOSOMAL PROTEINS GENES. BINDS THE ARS-ELEMENTS FOUND IN MANY PROMOTERS. BINDS TO THE SEQUENCE 5'-TCN(7)ACG-3'.

SUBCELLULAR LOCATION: NUCLEAR.

PTM: EXTENSIVELY PHOSPHORYLATED ON SER AND THR RESIDUES.

PTM: EXTENSIVELY PHOSPHORYLATED ON SER AND LOCAL TO YEAST RAP1.
